Giulio Luzzati, Ph.D.

Personal Information

Research Software Engineer
1b Mill Road, Haddenham, Ely
Phone: +44 07397 791131
e-mail: giulio.luzzati@live.it
LinkedIn: https://it.linkedin.com/in/giulio-luzzati-9bb79245
Born: 19/10/1984, Genova, Italy

Education

University of Genova, Genova, Italy
Ph.D. in Computer Science **Apr 2016**
Thesis topics: resource allocation, communication networks, signal processing
Professional Engineering Qualification **Oct 2012**
M.Sc. in Telecommunication Engineering **May 2012**

Professional and Academic Experience

Cambridge Touch Technologies (CTT), Cambridge, United Kingdom
Senior DSP Engineer **Oct 2018 - Current**

CTT is a touch screen technology company, focused on providing cost effective and minimal overhead ways to integrate pressure sensing capabilities to touchscreen technologies. At CTT I design and manage the realization of several projects and tools to diagnose, test and benchmark components of the hardware stack. On top of that, I was tasked with the rearchitecturing and realization of the company's software assets versioning and CI infrastructure.

5G Innovation Centre, Guildford, United Kingdom
Senior Software Engineer **Nov 2017 - Oct 2018**

The 5GIC is a research centre within the University of Surrey, featuring one of the biggest 5G testbeds in the UK and carrying on research and standardization activity in close partnership with the largest players in the field. The 5GIC's testbed is a complete cellular network, used to test and showcase several research ideas ranging from radio technology to network concepts. At the 5GIC I was part of the core network development team. My contribution as a software engineer was to develop and maintain the code base for the core network.

AKYA ltd, Swindon, United Kingdom
DSP Software Engineer **Dec 2016 - Nov 2017**

AKYA was a small startup whose core business was a novel "dynamically reconfigurable logic" approach to hardware design. AKYA's technology was targeted at low power, low cost applications (as opposed to, e.g., FPGA), providing "just enough" reconfigurability to meet the design requirements.
At AKYA I contributed as a software engineer to the codebase of a framework that allowed to synthesise logic starting from a very high-level functional description of the hardware. My role in the team was to design and develop algorithms and software components that expand and integrate the existing framework, as well as creating testing and data visualization tools.

DSP Lab, University of Genova, Genova, Italy
Post Doctoral Research Fellow **Jan 2016 - Nov 2016**
Ph.D. Student **Jan 2013 - Dec 2015**
Research Fellow **Oct 2012 - Dec 2012**

During my academic experience at the DSP Labs, as Ph.D. student and then research fellow, I carried out academic (research and teaching) activity, along with collaborations with SMEs and some of the key industries of Italy's communications and tech (Telecom Italia, Leonardo). My main area of research were resource allocation and mathematical optimization in communication networks and in signal processing

In a Nutshell

Technical Skills

C++	●●○	C	●●●
Python	●●●	Matlab	●●○
Latex	●●○	Java	●○○

Software Architecture	Build Systems	CI, DevOps
Containerization	Embedded Programming	Basic Hardware Diagnostics
Service Oriented Architecture	Agile Software Development	GNU/Linux OS

Strong experience in computer networks
Strong background in signal processing
Statistics, mathematical optimization and data science
Working knowledge in machine learning
Scientific writing and teaching

Relevant Projects

Signal Injector for Pressure Sensors
Project manager, Cambridge Touch Technologies **2019**

The goal of the project was to realize a signal injector, able to "simulate" the behaviour of the physical sensor. An array of DACs at its core, the deliverable consisted in a small box, controlled via REST api, able to physically interface to the amplifier board. My role in the project:

- specified the requirements
- designed the high level architecture
- implemented driver, API
- integration (as slave component) with other existing diagnostic tools

The tool proved to be useful and usable, and after the prototype, several units of the tool have been commissioned and are in use by the hardware team.

Touchscreen Analyser
Project Manager, Cambridge Touch Technologies **2019**

This tool was aimed at diagnosing manifacturing defects of pressure sensing enabled touch panels. The scope of the project was to harness existing experiments and components in the company, and integrate them organically into a usable tool. The instrument analyses the electrodes of capacitive touch panels, and automatically generates easy to read reports containing physical measures and inferred features. My role in the project:

- designed the workflow, the data flow and system level architecture
- realized a simple GUI
- signal and data processing algorithms, i.e. extracting knowledge from the data
- automatic report generation

Human Touch Model
