Hello Bending Spoons,

I'm a software engineer with a strong scientific background.

I've started my career in the academic research, most of which involved smartphone app programming, where I grew my taste for "eternal inquisitiveness". I've been working for the last years in a few tech-oriented start-up companies. Started off as a software engineer, I've been steering my career more and more towards signal/data analysis and processing.

I currently work in a touchscreen technology company, developing and researching tools to diagnose and test different components of our technology stack. As an engineer, I seek for genericity, simplicity, and reusability. As a scientist, I appreciate the beauty of simple explanations and models derived from first principles.

As you can see from my recent projects on my resume, I've realized that what I love the most is analysing, transforming and visualising data to bring out the information hiding in it, and that I want data science to be the direction my career will take.

While looking for job posts to this aim, I got thrilled by the "What We Look For" section of your job description, and I felt it really resonating with my character, point by point.

I'm currently based in the UK, but I'd be glad to relocate to my home country.

Looking forward to hear from you,

Giulio
