Hello Bending Spoons,

I'm a software engineer with a strong scientific background.

I've started my career in the academic research, most of which involved smartphone app programming, where I grew my taste for "eternal inquisitiveness". I've been working for the last years in a few tech-oriented start-up companies. Started off as a software engineer, I've been steering my career more and more towards signal/data analysis and processing.

I currently work in a touchscreen technology company, developing and researching tools to diagnose and test different components of our technology stack. As an engineer, I seek for genericity, simplicity, and reusability. As a scientist, I appreciate the beauty of simple explanations and models derived from first principles.

As you can see from my recent projects on my resume, I've been leveraging my experience in signal processing and statistics to analyse, transform and visualise data, and I realized that I want data science to be the direction my career will take.

While looking for job posts to this aim, I got excited by the "What We Look For" section of your job description, as I felt it really resonating with my character, point by point.

I'm currently based in the UK, but I'll be glad to relocate for the right opportunity.

Looking forward to hear from you,

Giulio
